

The ValuechainScore™ modules uses Eurofiber Cloud Infra as our digital infra partner

Eurofiber Cloud Infra operates a network of modern, Tier III-designed data centers across the **Netherlands**, strategically located to support secure, high-availability infrastructure hosting. These facilities are situated in key regions including Amsterdam, Rotterdam, Utrecht, Arnhem, Groningen, and Brabant (e.g., Waalwijk/Steenbergen), providing geographically distributed sites that help ensure resilience, continuity, and regional access for IT operations and cloud deployments within the country.

These data centers house the physical servers and IT environments of customers in a carrier-neutral and highly secure environment. Each site is connected via redundant networks, enabling continuity and strong connectivity across locations while remaining within Dutch territory – an important factor for data sovereignty and compliance with local regulations.

To support robust security, quality, and operational standards, Eurofiber Cloud Infra's infrastructure is certified under multiple internationally recognized standards. Among the key certifications are:

ISO 27001 – Information Security Management, ensuring robust controls over data integrity, confidentiality and availability.

ISO 27017 – Cloud-specific information security guidelines.

ISO 9001 – Quality management system standard for consistent service delivery.

ISO 14001 – Environmental management system standard.

ISO 50001 – Energy management standard, reflecting a focus on efficiency and sustainability.

ISAE 3402 Type II – Outsourcing controls standard, demonstrating secure and well-managed service operations.

These certifications provide assurances to customers and auditors that the physical data centre environments, processes and controls meet stringent international benchmarks for security, reliability, quality and sustainability.

Preparing for NIS 2

Our data-center partner is implementing The Network and Information Security Directive (NIS2) as the EU-wide legislation on cybersecurity, providing legal measures to enhance the overall level of cyber security and standardize cyber resilience across the EU.

EU member states are required to transpose NIS2 into their national legislation by 17th October 2024, which means organizations should be ready to achieve compliance well in advance.

NIS2 is the second Network and Information Security Directive, extending the scope across more sectors, with more stringent requirements and bringing in stricter penalties for non-compliance compared with the existing NIS.

Apart from a few exemptions, it applies to medium and large-sized companies (50 or employees or an annual turnover of €10 million), in sectors including healthcare, digital services and infrastructure, banking and finance, and food.

The main aim of the NIS2 Directive is to promote a cyber security culture and ensure the resilience of essential services, under three key areas:
